EXECUTIVE SUMMARY

Lockwood, Andrews & Newnam, Inc. (LAN) was contracted by Tax Increment Reinvestment Zone No. 17 (TIRZ 17) to perform and mobility study on Memorial Drive between Beltway 8 Northbound Service Road (NSR) and West Bough Lane in Houston, Texas. LAN has been tasked with analyzing the intersections and investigating left-turn lane alternatives aimed at improving operations. A summary of alternatives is as follows:

Alternative	Description
No Build	<ul style="list-style-type: none"> No Additional Improvements Proposed
Alternative 1	<ul style="list-style-type: none"> Add an eastbound left-turn lane at Town and Country Village East Driveway
Alternative 2	<ul style="list-style-type: none"> Add an eastbound left-turn lane at Town and Country Village West Driveway Add a westbound left-turn lane at Town and Country Village East Driveway

LAN recommends that two eastbound left-turn lanes be constructed on Memorial Drive (Alternative 2). This recommendation is based on intersection capacity utilization (ICU) level of service (LOS) as well as potential safety benefits. Left-turn lanes have been shown to minimize turn-related crashes and minimize delay to through traffic. Based on these potential benefits, LAN recommends the following:

- Install an eastbound left-turn lane on Memorial Drive and Town and Country Village West Driveway,
- Install an eastbound left-turn lane on Memorial Drive and Town and Country Village East Driveway, and
- Update pavement markings on Memorial Drive between Beltway 8 NSR and West Bough Lane.

INTRODUCTION

Lockwood, Andrews & Newnam, Inc. (LAN) has been contracted by Tax Increment Reinvestment Zone No. 17 (TIRZ 17) to perform a traffic study on Memorial Drive between Beltway 8 Northbound Service Road (NSR) and West Bough Lane in Houston, Texas. Recent development, including the expansion of Town and Country Village north of the study area has increased traffic; as such, this traffic study was authorized to identify where traffic problems occur and recommend improvements on Memorial Drive. This report has been prepared to document the traffic study, present results found during the analysis and provide recommendations.

STUDY LOCATION

Memorial Drive is an east-west four-lane road that is currently free-flow between Beltway 8 NSR and West Bough Lane. Traffic signals are located at each end of the study area and are located at Beltway 8 NSR and West Bough Lane. The study area is identified in Figure 1 and involves four intersections:

- Memorial Drive and Beltway 8 NSR,
- Memorial Drive and Town and Country Village West Driveway,
- Memorial Drive and Town and Country Village East Driveway, and
- Memorial Drive and West Bough Lane.

Beltway 8 NSR is a four-lane, one-way road at the northbound approach to Memorial Drive and is the eastern intersection of a partial diamond type interchange. Town and Country Village West Driveway and Town and Country Village East Driveway are both four-lane driveways that form three-leg "T" intersections with Memorial Drive. Both driveways have dedicated left-turn and right-turn lanes at the southbound approaches with Memorial Drive. West Bough Lane forms a four-leg intersection with Memorial Drive. Memorial Drive has dedicated left-turn lanes

Memorial Drive Drainage and Mobility

eastbound and westbound at West Bough Lane, while West Bough Lane has a dedicated right-turn lane at the southbound approach with Memorial Drive. South of Memorial Drive, West Bough Lane, also called Broken Bough Drive, is a two-lane road. Figure 2 and Figure 3 show No Build Conditions on Memorial Drive.

Many private residences exist to the south and east of the study area. Town and Country Village north of the study area contains commercial developments including a gas station, grocery store, retail shops and restaurants. Town and Country Village West Driveway and Town and Country Village East Driveway lead directly to a strip center and grocery store, respectively. Recent expansion to Town and Country Village is estimated to add over 33 thousand daily trips.

METHODOLOGY

Methodology used for this traffic study is as follows:

- Site investigation and observation,
- Collect turning movement counts (TMCs) at the study intersection for six hours,
- Analyze Existing Conditions and future No Build Conditions on Memorial Drive,
- Analyze proposed Build Conditions on Memorial Drive under current year and future year conditions,
- Mitigate failing conditions (if any), and
- Document analysis and findings and provide recommendations.

DATA COLLECTION

LAN collected data with respect to intersection geometry, striping, signage and visible utilities during a field visit to the intersection on December 11, 2008 (site photographs are located in Appendix A). Memorial Drive is a four-lane road with approximate 12-foot lanes. The posted speed on Memorial Drive is 35 mph while the speed limits on West Bough Lane and Beltway 8 NSR are 30 mph and 50 mph, respectively. Pedestrian crosswalks, pedestrian signals and pushbuttons are provided at these two intersections. There is no posted speed on either of the Town and Country Village driveways. All pavement and pavement markings were observed to be in fair to poor condition.

Numerous private driveways exist on the south side of the study area that service residences along Memorial Drive. Sidewalks are located on both sides of Memorial Drive and curb ramps appear to be Americans with Disabilities Act (ADA) compliant at both Beltway 8 NSR and West Bough Lane. Curb and gutter drainage is utilized on Memorial Drive, Beltway 8 NSR and West Bough Lane.

Memorial Drive Drainage and Mobility

Data collected for this study included: 24-hour traffic volumes, six-hour TMCs and pedestrian counts. On an average weekday, peak hour traffic on Memorial Drive exceeds 1,500 vehicles per hour. Peak hours were identified between 7:30 AM – 8:30 AM (AM peak hour), 12:00 PM – 1:00 PM (Midday peak hour) and 4:30 PM – 5:30 PM (PM peak hour). A summary of traffic data collected is included in Appendix B.

ANALYSIS

This traffic study analyzes three different alternatives for AM, Midday and PM peak hours. Each scenario is analyzed for current year 2009 and under future traffic conditions in year 2014; a total of 18 scenarios were analyzed. Data was input into Synchro 6.0 traffic models based on TMCs and balanced using 24-hour traffic volumes. Projected traffic volumes were calculated utilizing Houston-Galveston Area Council (H-GAC) growth rates. H-GAC growth rates yield a 1.0 percent annual growth rate on Memorial Drive between years 2009 and 2014. This growth rate was assumed to be uniform throughout the study area and was applied to all traffic volumes.

Existing and No Build Conditions

Existing and No Build Conditions consist of no modification to current roadway traffic control, alignment or geometry. These scenarios serve as a base condition and were analyzed for current year (2009) and future year (2014) traffic conditions for both AM and PM peak hours. Existing and No Build Condition drawings for the study area are presented in Exhibit C1 and Exhibit C2 in Appendix C.

Proposed Conditions

Alternative 1 – Add One Eastbound Left-turn Lane

Alternative 1 involves the construction of a single eastbound left-turn lane at the Town and Country Village East Driveway. The proposed left-turn lane would be designed to City of Houston standards and is 200 feet in length (100 feet storage and 100 feet taper). The proposed left-turn lane is designed to remove left-turn traffic from impeding eastbound through traffic on Memorial Drive. Two eastbound and two westbound through lanes are maintained on Memorial Drive as well as the existing sidewalk. Drawings showing improvements proposed in this alternative are in Exhibit C3 and Exhibit C4 in Appendix C.

Alternative 2 – Add Two Eastbound Left-turn Lanes

Alternative 2 involves the construction of two eastbound left-turn lanes; one at the Town and Country Village West Driveway and the other at the Town and Country Village East Driveway. Both left-turn lanes are designed to City of Houston standards and are 200 feet in length (100 feet storage and 100 feet taper). The proposed left-turn lanes are designed to remove left-turn traffic from impeding eastbound through traffic on Memorial Drive. Two eastbound and two westbound through lanes are maintained on Memorial Drive as well as the existing sidewalk. Drawings showing improvements proposed in this alternative are in Exhibit C5 and Exhibit C6 in Appendix C. A summary of all alternatives is as follows:

Table 1 - Summary of Alternatives	
Alternative	Description
No Build	<ul style="list-style-type: none"> No Additional Improvements Proposed
Alternative 1	<ul style="list-style-type: none"> Add an eastbound left-turn lane at Town and Country Village East Driveway
Alternative 2	<ul style="list-style-type: none"> Add an eastbound left-turn lane at Town and Country Village West Driveway Add a westbound left-turn lane at Town and Country Village East Driveway

Traffic Analysis

Traffic analysis tasks were conducted using Synchro, Version 6.0. Synchro follows procedures developed in the *Highway Capacity Manual* (HCM 2000) (1) and analyzes the study area in its entirety rather than as a series of isolated intersections and driveways. The HCM 2000 is an industry accepted standard for intersection capacity analysis, queuing analysis and signal timing. Synchro allows users to model traffic situations and conduct traffic operational analyses on these models. Various measures of effectiveness (MOEs) can be extracted such as level of service (LOS), delay and vehicle queue lengths. Output can be used to make comparisons between proposed alternatives.

Control delay, measured in seconds per vehicle (sec/veh), was used to determine LOS at intersection approaches. Control delay is the portion of total delay attributed to the traffic control used at an intersection. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay (1). Table 2 provides criteria for determining LOS based on delay per vehicle.

LOS	Delay Range for Unsignalized Intersections (sec/veh)	Delay Range for Signalized Intersections (sec/veh)
A	≤10	≤10
B	>10 and ≤15	>10 and ≤ 20
C	>15 and ≤25	>20 and ≤ 35
D	>25 and ≤35	>35 and ≤ 55
E	>35 and ≤50	>55 and ≤ 80
F	>50	>80

The concept of LOS as explained in the HCM 2000 is that it is similar to grades in school – A being the best, F the worst. A more detailed description of LOS for signalized intersections is provided below:

Memorial Drive Drainage and Mobility

- *LOS A* describes operations with very low delay, up to 10 sec/veh. This level of service occurs when progression is extremely favorable and most vehicles arrive during the green light. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.
- *LOS B* describes operations with delay greater than 10 and up to 20 sec/veh. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.
- *LOS C* describes operations with delay greater than 20 and up to 35 sec/veh. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level, or all vehicles may not pass through on one cycle. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
- *LOS D* describes operations with delay greater than 35 and up to 55 sec/veh. At level D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
- *LOS E* describes operations with control delay greater than 55 and up to 80 sec/veh. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent occurrences.
- *LOS F* describes operations with control delay in excess of 80 sec/veh. This level, considered to be unacceptable to most drivers, often occurs with oversaturation, that is,

when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing factors.

A second traffic analysis was performed using the *Intersection Capacity Utilization* (ICU) method. The ICU method differs from the HCM 2000 method for producing MOEs, as the HCM 2000 uses control delay as the primary MOE, while the ICU method uses traffic volume and capacity (2). Like the HCM 2000 method, ICU uses a LOS scale; however the ICU method uses a scale where LOS A is best and LOS H the worst. Using the ICU method is preferred for this study as it analyzes all intersection approaches, whereas only intersection approaches that have traffic control (e.g., stop signs or traffic signals) are analyzed using the HCM 2000 method.

RESULTS

Traffic Analysis

Results of the traffic analysis are presented in Table 3 for delay and LOS, while network MOEs are given in. Detailed results are located in Appendix D.

HCM 2000 analysis results show that left-turn lanes included in Alternative 1 and Alternative 2 only marginally increase performance with respect to delay at intersections on Memorial Drive. Furthermore, network MOEs do not improve when left-turn lanes are analyzed on Memorial Drive. No failing conditions (LOS E or LOS F) resulted in any analysis using the HCM 2000. The HCM 2000 analysis is not ideal for this project, as proposed improvements do not affect approaches that use traffic control such as stop signs or traffic signals.

Improvements as a result of adding left-turn lanes are minimal when using HCM 2000; however, the ICU method shows that Alternative 2 provides the best LOS when using the ICU scale (see Table 5). The ICU method shows that where capacity (storage lanes) is added, intersections function at a higher LOS. Therefore, the addition of left-turn lanes eastbound at Town and

Memorial Drive Drainage and Mobility

Country Village East Driveway and Town and Country Village West Driveway allows for an increase in intersection performance. Alternative 1 shows only performance increases where capacity is added at Town and Country Village West Driveway. Where no capacity is added, (Beltway 8 NSR and West Bough Lane), ICU does not show any performance increase.

Safety Benefits

Each proposed alternative incorporates a combination of eastbound left-turn lanes on Memorial Drive. Safety benefits associated with adding left-turn lanes are as follows (3):

Left-turn Lane Safety Benefits

- Minimizes turn-related crashes and
- Eliminates unnecessary delay to through movements.

Figure 4 provides a method for analyzing the need for a left-turn lane on the major approach of a stop controlled intersection (3). Using the curve in this figure, both Town and Country Village West Driveway and Town and Country Village East Driveway warrant eastbound left-turn lanes. During the AM peak hour, the *Left-turn Volume* is 24 vehicles and the *Opposing Volume* is 556 vehicles on Town and Country Village West Driveway, while the *Left-turn Volume* is 75 vehicles and the *Opposing Volume* is 547 on Town and Country Village East Driveway. Both points are above the curve in Figure 4 and a northbound left-turn lane is warranted.

*Town and Country Village East Driveway Data Point is off the chart, but is above the curve.

Figure 4 - Guidelines for Determining the Need for a Left-Turn Lane (3)

Cost Estimates

An analysis was performed to determine the cost necessary for implementation of each alternative. The cost estimate represents probable costs; any costs related to utility relocation, landscaping or right-of-way acquisition are not included.

Table 6 provides a breakdown of costs associated with each alternative for year 2009 dollars. Detailed cost estimates are in Appendix E.

Table 6 - Cost Estimates		
No Build	Alternative 1	Alternative 2
-	\$92,000	\$189,000

RECOMMENDATIONS

LAN recommends that two eastbound left-turn lanes be constructed on Memorial Drive (Alternative 2). This recommendation is based on ICU LOS as well as potential safety benefits. Left-turn lanes are known to minimize turn-related crashes and minimize delay to through traffic. Based on these potential benefits, LAN recommends the following:

- Install an eastbound left-turn lane on Memorial Drive and Town and Country Village West Driveway,
- Install an eastbound left-turn lane on Memorial Drive and Town and Country Village East Driveway, and
- Update pavement markings on Memorial Drive between Beltway 8 NSR and West Bough Lane.
