1.0 Executive Summary

TxDOT is proposing a mobility project for approximately 5,000 linear feet of Memorial Drive, extending from Beltway 8 northbound frontage road to Tallowood Road. The limits of this project are contained within the City of Houston Right-of-Way under Memorial City Tax Increment Reinvestment Zone (TIRZ 17). The project is partially federally funded; thus, TxDOT is managing the design and construction phases for this project.

LAN was contracted by TIRZ 17 to perform a drainage impact study for the comprehensive Preliminary Engineering Report (PER) and design along the above-mentioned project limits. This drainage study presents the hydrologic and hydraulic analyses to demonstrate no adverse impact to the Memorial Drive corridor and the surrounding drainage systems.

This study analyzed existing and proposed condition peak flow rates and hydrographs for two storm drainage systems with outfalls located at 1) Station 2+20 (System A Outfall) and 2) Station 43+40 (System B Outfall). System A outfalls into a 78" reinforced concrete pipe (RCP) storm sewer at the intersection of Memorial Drive and Beltway 8 northbound frontage road, which further conveys flow southward through the existing storm sewer. System B outfalls into a 9'x9' reinforced concrete box (RCB) that conveys W153-00-00 through its intersection with Memorial Drive. Under the proposed conditions, all newly-constructed storm sewers in System B will outfall into the existing 9'x9' conveyance culvert for W153-00-00. After leaving the project limits through System A and System B outfalls, the respective outfall systems will eventually drain to Buffalo Bayou (W100-00-00).

A drainage analysis was performed to verify that the proposed storm sewer systems have adequate capacity to accommodate the runoff from the project ROW and contributing drainage areas without resulting in adverse impacts to the receiving outfalls. The existing and proposed storm sewer systems were analyzed for 2-year, 10-year and 100-year storm events. The proposed condition flows were compared against the existing conditions flows to demonstrate no increase in peak flows. Peak existing storage volumes are 1.4, 1.9, and 3.3 acre-feet for the 2-, 10-, and 100-year storms, respectively. Peak proposed storage volumes are 4.7, 9.9, and 16.9 acre-feet for the 2-, 10-, and 100-year storms, respectively.

Memorial Drive is topographically high compared to areas around it and therefore has minor ponding for all evaluated events except for the area just south of W153-00-00 which experiences 100-year overtopping into the roadway. Ponding is present along and outside the right-of-way and relies on storm sewers to drain to the current outfalls at Beltway 8 and W153-00-00. Upstream flow from W153-00-00 overtops Memorial Drive for the 100-year, 24-hour storm event and overland storm water runoff continues south on Somerset Place and Legend Lane to W153-00-00 and ultimately to Buffalo Bayou. Mitigation measures shall consist of in-line detention for System B in the form of dual 10'x5' and dual 10'x10' reinforced concrete box (RCB) culverts with inline restrictors that will connect to the existing 9'x9' RCB. Based on the hydrologic and hydraulic analyses and the proposed storm sewer improvements, the proposed project does not cause adverse impacts for the 2-year, 10-year and 100-year storm events.

2.0 Introduction

2.1 Project Description

The Memorial Drive project limits are classified as an urban local road within the City of Houston limits. The existing roadway consists of 40-foot wide undivided pavement with either a curb and gutter or roadside ditch drainage system along with 4-foot sidewalks on each side. Runoff from the project drains to the existing storm sewer system through a combination of roadside ditches and storm sewer. The roadway within the project limits has a prevailing Right-of-Way (ROW) of 100 feet. The existing and proposed roadway cross sections are presented in **Exhibit 1**.

The proposed roadway improvements include four 11-foot travel lanes with a 6- to 20-foot raised median, left turn lanes at all proposed median openings, and upgrade of existing traffic signals at Beltway 8 and West Bough Ln. Proposed drainage improvements include the installation of curb and grate inlets and oversized reinforced concrete boxes to provide in-line detention along the project limits for the purposes of mitigating drainage impacts. Other project amenities include the installation of an 8-foot wide pedestrian pathway along both sides of Memorial Drive, driveway replacements, the upgrade and/or replacement of existing public utilities as required, improved roadway and pedestrian lighting, as well as additional softscaping and landscaping amenities to promote a pedestrian friendly environment along the project corridor.

Referencing existing conditions, the proposed roadway profile includes lowering in some areas to allow positive drainage to and within the roadway, except at the W153-00-00 crossing area where it is important to maintain the current road profile. Ensuring the revised road profile does not adversely impact the rate of overland sheet flow across Memorial Drive during extreme rainfall events to properties on either side of Memorial Drive is a high priority.

The project currently drains to W153-00-00 and the storm sewer network at Beltway 8 and, due to limited ROW in this area, there are no feasible locations for off-site detention. Therefore, the following improvements are proposed to provide inline detention. The following improvements and the associated project stations can be found in the Memorial Drive construction plan and profile sheets: 1) Ranging from 3’x3’ RCB to 4’x4’ RCB from West Bough Lane to an existing 42” RCP at Beltway 8, 2) dual 10’x5’ RCBs from the intersection of Memorial Drive and West Bough Lane to Sta 30+10, 3) dual 10’x10’ RCBs from Sta 30+10.00 to the proposed 42” RCP restrictor at the existing 9’x9’ box culvert between Sta 43+00 and 44+00, and 4) dual 10’x10’ RCBs from the intersection of Memorial Drive and Tallowood Road to the proposed 24” RCP restrictor at the existing 9’x9’ RCB between Sta 43+00 and 44+00. The dual trunklines serve the purpose of providing additional storage for runoff along Memorial. The restrictors at the junction of Memorial Drive and the W153-00-00 conveyance assist in maintaining flows in reference to existing conditions. These improvements are not to divert water from any other watersheds in the area to W153-00-00. No watershed drainage boundary modifications are proposed as part of this project.

Lowering of the road allows stormwater to collect in low regions and provides additional storage on the roadway surface during extreme events. This is a net benefit for minimizing downstream runoff; however, additional water on the roadway during extreme events may impact mobility.

During less extreme events, overland flows move to the low regions of Memorial Drive. Here, inlets capture and convey storm water to HCFCD Channel Unit No. W153-00-00 via the existing 9'x9' RCB. All connections to this existing box culvert will be restricted to a smaller pipe size (a 42" RCP restrictor from the west and a 24" RCP restrictor from the east) to mitigate impacts to W153-00-00 and mimic existing conditions.

2.2 Purpose of Study

The purpose of this study is to present the hydrologic and hydraulic analysis, impacts and corresponding mitigation measures for the proposed reconstruction and access management of Memorial Drive.

The hydrologic analysis shall consist of examining the runoff impacts associated with the proposed roadway improvements and drainage collection system modifications. Mitigation measures shall consist of providing in-line detention within the project ROW. The hydraulic analysis shall consist of examining the design capacity of each affected drainage structure to determine hydraulic adequacy and propose any structure replacement as well as determine any upstream and downstream hydraulic impacts. The drainage study provides detailed analyses for all conventional storm drainage structures.

2.3 Design Criteria and References

The hydrologic and hydraulic analyses were performed in accordance with the methodology and procedures established in the following documents:

- *Infrastructure Design Manual*, City of Houston: Houston Public Works; September 2018.
- *Flood Insurance Study for Harris County, Unincorporated Area (FIS-4802287L)*; Federal Emergency Management Agency; dated June 18, 2007
- *Field Survey topographic data*, by Baseline Corporation dated 2007

2.4 Flood Hazard Area

The proposed project resides in the City of Houston and is shown on the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) Panel No. 48201C0645L, data revised February 12, 2016. The effective FIRM panel indicates that the project crosses Harris County Flood Control District (HCFCD) Channel Unit No. W153-00-00 (Tributary to Buffalo Bayou). The effective FIRM panel indicates that the proposed project is located inside of the FEMA 500-YR (Zone X) floodplain. No base flood elevations have been established for Memorial Drive within the project limits. No fill is anticipated to be placed in the 100-year FEMA floodplain for this project. The limits of the project are shown on the FEMA FIRM in **Exhibit 2**.

2.5 Project Datum

The project datum for the proposed roadway improvements is referenced North American Vertical Datum of 1988 with 2001 adjustment. No vertical adjustments to the datums are necessary for this study.

2.6 Analysis Methodology

The existing and proposed peak runoff flows for each drainage area were calculated for the 2-year, 10-year and 100-year storm events. Since this study has been ongoing for several years, all rainfall rates utilized in the modelling were agreed upon prior to the Atlas 14 updates made to the TxDOT Hydraulic Design Manual in September of 2019. The drainage analysis for Memorial Drive is being performed using InfoWorks ICM, a two-dimensional (2D) dynamic model, developed as part of the TIRZ 17 Regional Drainage Study (RDS). The model was calibrated and validated at previous significant rainfall events and concur with observed conditions for the TIRZ 17 region. The storm sewer systems were evaluated with InfoWorks ICM using the City of Houston Infrastructure Design Manual (September 2018). The 100-yr HGL was evaluated per the design criteria, as summarized below:

1) Maximum ponding depth at low points in the street shall not be 18 inches above the top of curb elevation;
2) Maximum ponding depth at high points in the street shall not be 6 inches above the top of curb elevation;
3) The maximum ponding elevation (MPE) at any point along the street shall not be higher than the natural ground elevation at the right-of-way;
4) Maximum ponding depth shall not exceed 12 inches below the finished slab elevations along the project;
5) Ponding of surface runoff is not allowed in the highest travel lane in each direction.

An existing model of the project area was revised to provide a greater level of detail along Memorial Drive. The existing and proposed drainage systems were analyzed based upon:

- Collecting data for the existing drainage facilities from field investigations, as-built plans, the COH Geographic Information Management System (GIMS), and topographic survey.
- Developing project drainage area maps utilizing LiDAR topography, COH GIMS data, existing storm sewer infrastructure, prior studies and field investigations.
- Identifying drainage system outfalls for the project.
- Determining land use for c values in each drainage area and land use patterns within each drainage area.
- Analyze existing and proposed drainage systems in InfoWorks ICM v8.0 and Winstorm v3.05.

3.0 1-D Analysis

A hydrologic analysis was performed to determine the on-site and off-site peak discharges along the project alignment. The flow rates for the 2-year, 10-year and 100-year design frequencies were computed for each of the contributing drainage areas. This section presents the methodologies, watershed parameters and description of drainage areas associated with the runoff calculations for subarea within the project limits.

3.1 Drainage Areas

The drainage areas for each existing and proposed structure were delineated using a combination of LiDAR data and overland flow patterns from GIMS and survey. The overland flow patterns and ponded depths were determined from GIMS. As-built plans for the roadway were also referenced in determining drainage boundaries and storm sewer tie-in locations for off-site drainage areas. A field visit was conducted to verify the drainage area boundaries and drainage patterns. The overall watershed areas within the project limits are broken into two drainage systems designated as Outfall A towards Beltway 8 and Outfall B to channel W153-00-00. The boundaries of these drainage systems primarily follow subdivisions' divides and HCFCD channel. The prominent direction of flow within the project area is from west to east. The overall drainage area map and internal drainage area map can be seen in **Exhibit 3**.

Table 1. Drainage Areas and "C-Values" for Existing and Proposed Conditions

Drainage Area ID	Existing C Value	Proposed C Value	Drainage Area ID	Existing C Value	Proposed C Value	Drainage Area ID	Existing C Value	Proposed C Value	Drainage Area ID	Existing C Value	Proposed C Value

B-41	0.80	0.80	B-101	0.73	0.87	B-116A	0.83	0.84	W-153	0.52	0.52

3.2 Land Use

The predominant land use for the project's contributing drainage areas is categorized as urban and fully developed. The majority of the contributing drainage areas are multi-family residential and commercial areas. The existing topography in the proposed project area slopes largely from the relatively high elevations at Beltway 8 to the lower lying region near channel W153-00-00 along Memorial Drive. The land uses for the offsite areas were evaluated using aerial photographs and project topographic files. Along the project corridor, the majority of the offsite contributing drainage area are located north of Memorial Drive within the W153-00-00 watershed. The existing and proposed land use maps can be seen in **Exhibit 4**.

3.3 1-D Hydrologic Methodology

The hydrologic analysis for the proposed project utilized the Rational Method to compute the runoff peak discharges for the contributing drainage areas.

3.4 Rational Method

The Rational Method parameters include the drainage area, the runoff coefficient, time of concentration, and rainfall intensity. The Rational Method equation is provided as Equation 1.

$$Q = CIA \qquad \textit{Equation 1}$$

In which: Q (cfs) is the computed peak runoff discharge,

C is the runoff coefficient,

I (in/hr) is the rainfall intensity,

A (ac) is the drainage area.

Runoff coefficients (C-value) for the roadway and contributing drainage areas are based on land use. Within the project ROW, the impervious cover was measured from a detailed survey and "as-built" construction plans. The impervious areas within the ROW considered pavement, driveways, and intersecting paved roadways. The offsite contributing drainage area impervious covers were determined by using aerial photography and the project topographic files. The C-values selected for the offsite contributing areas included 0.80 for multi-family/business areas and 0.54 for residential/family unit areas. For the large W153 watershed area a composite C was evaluated, and TC was adjusted to match peak flows determined in the 2D analysis for a 10yr event. A summary of the runoff coefficients is provided in **Table 2**. The runoff coefficients were taken from Chapter 9 of the City of Houston Infrastructure Design Manual.

Table 2. Summary of Rational Method Runoff Coefficients "C-Values"

Land Use Description	C-Value
Pavement	0.90
Multi-family/Business areas	0.80
Residential	0.54
Grass	0.35

Time of Concentration was determined by utilizing the time of concentration equation from the City of Houston IDM, Chapter 9.

$$TC = 10A^{0.1761} + 15 \qquad \textit{Equation 2}$$

In which: TC (minutes) is the computed time of concentration,

A (ac) is the drainage area

Rainfall Intensity calculations using the Rational Method is dependent on the time of concentration and the intensity coefficients (e, b, and d), which are storm frequency- and location-specific. The entire project resides within City of Houston, the e, b and d factors were taken from the TxDOT values provided in the TxDOT GeoPAK Drainage library updated in 2016. The equation for computing the rainfall intensity is provided in Equation 3. The multiple frequency intensity coefficient values for Harris County are provided in **Table 3**.

$$I = \frac{b}{(d+Tc)^e} \qquad \textit{Equation 3}$$

In which: T_C (min) is the time of concentration,

I (in/hr) is the rainfall intensity

Table 3. Rational Method e, b, d Coefficients – TxDOT (July 14, 2016)

Coefficient	2-year	10-year	100-year
e	0.7939	0.7829	0.7720
b (in.)	57.73	86.47	136.33
d (min.)	9.48	11.27	14.08

3.5 Peak Discharge Rates

A summary of existing and proposed peak discharge rates is presented in **Exhibit 5**. The peak flow of each drainage area was calculated using the Rational Method. The proposed storm sewers were evaluated for the 2, 10 and 100-year storm events, and designed for the 2-year storm event. The 10-yr and 100-yr hydraulic analysis was performed using a 2D approach to better analyze hydraulic behavior when the storm sewer system is surcharged.

3.6 2-yr Hydraulic Grade Line Determination

The proposed storm sewer was modeled using Microstation GeoPAK application and was used to develop a 2-yr hydraulic grade line for both systems. The 2-yr results can be found in Appendix 2 and Appendix 3.

4.0 2-D Analysis

4.1 Existing Drainage Conditions

The Memorial Drive project is located within the Buffalo Bayou watershed. The existing roadway within the project limits is served by two primary storm sewer systems (A and B). System A collects runoff from the areas north of Memorial from Beltway 8 to West Bough Lane. System B drains from just east of Beltway 8 to the east and then extending south to W153-00-00 and from Memorial Drive east of Paul Revere Drive to W153-00-00.

There are two primary outfall locations for this project:

- System A Outfall – Outfall A receives flow from the alignment following the northern and eastern extents of the ROW and conveys flow from the drainage area to the outfall at the intersection of Beltway 8 and Memorial Drive. It is composed of 24" RCP from West Bough Lane to the confluence at Sta 10+00. From Sta 10+00 to the confluence at Sta 7+00 the storm sewer is composed of 30" RCP and then continues as 42" RCP until terminating into Outfall A at the intersection of Beltway 8 and Memorial Drive.
- System B Outfall –Outfall B receives flow from the alignment following the northern and eastern extents of the ROW conveys flow from the drainage area to the outfall at W153-00-00. It is composed of dual 24" RCP from West Bough Lane to the confluence of the two pipes into a single 24" RCP at Sta 16+60. A single 24" RCP continues from this point until just south of the intersection of Memorial Drive and Old Oaks Drive. A grass-lined ditch then extends from Old Oaks Drive to just south of the intersection of Memorial Drive and Huntingwick Drive. Beyond Huntingwick Drive, dual 24" RCP's continue up to the intersection of Memorial Drive and Memorial Bend. From this intersection to Outfall B, the drainage system is primarily grass-lined ditch. To the east of W153-00-00 along the northern portion of the ROW, a 36" RCP conveys water from the intersection of Memorial Drive and Tallowood Road to Outfall B. The System B alignment following the southern and western extents of the ROW conveys flow from the drainage area to the outfall at W153-00-00. It is composed of grass-lined ditch from the intersection of Memorial Drive and West Bough Lane to Boheme Drive. From Boheme Drive to Sta 30+40, the storm sewer is 24" RCP and to 38+20 is 36" RCP. Sta 38+20 to Sta 39+00 is composed of 42" RCP until the storm sewer expands to 48" RCP at Sta 39+00. The size of the storm sewer remains the same from Sta 39+00 until Outfall B. The portion of the System B alignment west of West Bough Lane following the southern and western extents of the ROW conveys flow from the drainage area to its termination at the intersection of Memorial Drive and West Bough Lane. The system is composed of 18" RCP throughout this alignment.

Memorial Drive is topographically high compared to areas around it and therefore has minor ponding for all evaluated events except for the area just south of W153-00-00 which experiences 100-year overtopping into the roadway. Ponding is present along the right-of-way and relies on storm sewer to drain to the current outfalls at Beltway 8 and W153-00-00. Upstream flow from W153-00-00 overtops Memorial Drive for the 100-year, 24-hour storm event and overland storm

water runoff continues south on Somerset Place and Legend Lane to W153-00-00 and Buffalo Bayou.

4.2 Proposed Drainage Conditions

Compared with existing conditions, the proposed curb and gutter roadway profile will be lowered in certain areas to allow positive drainage from the ROW to roadway, except in the W153-00-00 crossing area where it is important to maintain the current road profile. It was a high priority to ensure the revised road profile did not adversely impact the rate of overland sheet flow across Memorial Drive during extreme rainfall events to properties on either side of Memorial Drive, which was validated from the 2D analysis. LAN iterated proposed roadway and drainage improvement options along Memorial Drive and determined a proposed design that has no adverse drainage impacts to areas along and upstream/downstream of the project.

Most of the project currently drains to Outfall B (W153-00-00), which matches existing drainage conditions. Due to limited ROW in this area there are no feasible locations for off-site detention for this project. Therefore, oversized storm sewer improvements of large reinforced concrete box culverts are proposed to provide inline detention. The larger underground storm sewer culverts are needed to store and hold runoff along Memorial and then restrict flows to W153-00-00 to maintain or reduce flows in comparison to existing conditions. These improvements are not to divert water from any other watersheds in the area to W153-00-00. No watershed drainage boundary modifications are proposed as part of this project.

Reducing the elevation of the road allows stormwater to collect in low regions, which provides additional storage on the roadway surface during extreme events. However, ponding on the roadway during extreme events can impact mobility. During less extreme events, water overland flows to the low regions of Memorial Drive where inlets capture and conveys it to HCFCD Unit W153-00-00 that crosses Memorial Drive as a 9'x9' box culvert. All connections to this existing box culvert will be restricted with a smaller pipe (currently a 42" RCP restrictor on the west, and 24" RCP restrictor on the east) to mitigate impacts to W153-00-00 and match existing conditions. Proposed box sizes along Memorial Drive include dual 10'x5' RCBs from West Bough Lane to Boheme Drive, and dual 10'x10' RCB's from Boheme Drive to W153-00-00. All existing drainage watersheds will match existing conditions. Ponding extents are reduced from existing to proposed conditions outside of the Memorial Drive ROW as seen in **Exhibits 6-11**.

Detention requirements were determined based on the difference between the total proposed impervious area of 255.80 acres and total existing impervious area of 253.99 acres. The required detention was determined to be 0.92 ac-ft. The proposed condition provides adequate storage volume to meet detention requirements.

The differences in the peak volume of stormwater stored in subsurface storm sewer and surface roadway or ditch detention within the Memorial Drive R.O.W. can be seen in Table 4 on the following page.

Table 4. Peak Storage Volumes within Memorial Drive R.O.W.

		Storm Sewer Volume (ac-ft)	Surface Volume (ac-ft)	Total Volume (ac-ft)
2-YR Event	Existing	0.8	0.6	1.4
	Proposed	4.7	0.0	4.7
	Delta	3.9	-0.6	3.3
10-YR Event	Existing	0.9	1.0	1.9
	Proposed	9.2	0.7	9.9
	Delta	8.3	-0.3	8.0
100-YR Event	Existing	1.1	2.1	3.3
	Proposed	13.4	3.5	16.9
	Delta	12.3	1.4	13.7

4.2.1 Hydraulic Grade Lines Along the Project Roadway

Water surface elevations were generated for 10-year and 100-year events for both existing and proposed drainage systems along the profile grade line. Due to the proposed surface adjustments which creates low points within the ROW to store runoff, locations were chosen along the roadway centerline for analyzing any impacts on water surface elevations caused by the proposed improvements. The analysis shows that the proposed drainage system does not meet the City of Houston criteria for the 100-year storm event. Maximum 100-yr ponding depths at high points exceed 6” above curb. Additionally, ponding occurs in all travel lanes for the 100-yr event. In lowering the roadway profile of Memorial Drive, overall flooding depths will be increased within the ROW in order to lessen the impacts to areas outside of the roadway.

Tables 5 and 6 show comparisons between the existing and proposed hydraulic grade lines at specific project roadway stations for the 10-year and 100-year 24-hour storm events, respectively. Roadway centerline stations that experience no ponding (due to the ground elevation exceeding the hydraulic grade line elevation) are assigned that location’s ground elevation.

Table 5. 10-yr Hydraulic Grade Line Comparison

Station	Plan Node ID	ICM Node ID	Existing HGL (ft)	Proposed HGL (ft)	Δ HGL (ft)
4+69.95	#B131	mem59	72.9	72.9	0.00

4.3 Summary of Roadway Drainage Analysis

As noted previously, the overall goal is to prevent or mitigate adverse hydraulic impacts to areas upstream and downstream of Memorial Drive. Additionally, Memorial Drive project roadway

alignment centerline was evaluated to ensure that the water surface elevation is maintained or lower than existing conditions despite the increased ponding depth generated from a lower roadway profile. As shown in Tables 5 and 6, the water surface elevations are reduced or maintained for the three analyzed storm events at the key alignment stations listed. The following impact analysis demonstrates that there are no impacts at critical locations, in terms of flow and water surface elevation, that would cause impacts to surrounding systems. These locations include system outfalls into both the Beltway 8 storm sewer and the downstream portion of channel W153-00-00. The upstream end of channel W153-00-00 to the north of Memorial Drive was evaluated to determine any potential impacts to the flow entering the Memorial Drive storm sewer and any rises in water surface elevations.

5.0 Impact Analysis

A runoff impact analysis was performed to determine the potential runoff impacts resulting from the proposed roadway improvements. The existing storm sewer is deficient and doesn't meet the 100-year criteria. The intention is to reduce the impacts of areas outside of the Memorial Drive ROW without impacting downstream systems. The roadway ponding criteria is not met for the maximum depth at high points, nor is it met for the removal of ponding from the highest travel lane in each direction. This section contains results from the impact analysis performed in ICM which analyzes the effect of the proposed storm sewer on the hydraulic grade lines and flow rates to upstream and downstream systems. Potential runoff impacts associated with the proposed roadway improvements are presented to quantify the influences to these surrounding systems.

5.1 Runoff and Outflow Impacts

The runoff impact analysis determined the increase in relative peak runoff at each outfall resulting from roadway improvements within the project ROW. No changes to the existing drainage patterns are proposed. Drainage areas are limited to those within project ROW. These areas represent the Memorial Drive ROW runoffs contributing to their respective outfalls.

The existing 10-year and 100-year analyses indicated that the existing storm sewer is severely inadequate and will require major storm sewer upgrades. Solely upsizing the storm sewer can significantly increase the flows at storm sewer outfalls. A hydraulic routing analysis was developed within the project limits to determine the existing flow rates and proposed flow rates. A mitigation analysis was conducted at Outfall B to determine the oversized storm trunk line sizes and the restrictor sizes needed to mitigate increases in peak flows. Runoff hydrographs were developed for both existing and proposed conditions.

The proposed storm sewer improvements include oversized storm sewer boxes and restricted storm sewer outfalls. This was done to increase the capture of overland flows prior to leaving the project ROW while eliminating adverse impacts to the HCFCD channel at the outfall. The hydraulic analysis demonstrated that the proposed drainage improvements will flatten the hydraulic grade line (HGL) slopes within the proposed system trunk line. The increased capacity of the proposed system helps to maintain the water surface elevation in the ROW relative to the tailwater conditions at W153-00-00 at the downstream end of System B.

The proposed Memorial Drive drainage improvements include:

- Replacements of the existing 42" RCP storm sewer along the northern and eastern extents of the Memorial Drive ROW from Beltway 8 to West Bough Lane with 4'x4' and 3'x3' RCB sections, which will connect to Outfall A (West Sam Houston Roll Road SBFR) through a 24" RCP restrictor.
- Replacement of the existing 18" RCP storm sewer along the southern and western extents of the Memorial Drive ROW from Beltway 8 to West Bough Lane with 48" RCP from Sta 4+60 to West Bough Lane.

- Replacement of the existing drainage system along both extents of the Memorial Drive ROW with dual 10'x5' RCBs from West Bough Lane to Sta 30+00.
- Replacement of the existing drainage system along both extents of the Memorial Drive ROW with dual 10'x10' RCBs from Sta 30+00 to Outfall B. At the outfall, 42" RCP restrictor is proposed to reduce outflow from the proposed storm sewer into the existing 9'x9' box culvert at W153-00-00.
- Replacement of the existing 36" RCP storm sewer traversing the northern edge of the Memorial Drive – Tallowood Road intersection with 48" RCP.
- Replacement of the existing 36" RCP storm sewer from Tallowood Road to the outfall at W153-00-00 with dual 10'x10' RCBs. At the outfall, 24" RCP restrictor is proposed to reduce outflow from the proposed storm sewer into the existing 9'x9' box culvert at W153-00-00.
- Installation of a 36" RCP to connect the proposed 36" RCP traversing the southern edge of the Memorial Drive – Tallowood Road intersection with the proposed dual 10'x10' RCBs at Sta 48+00.

The InfoWorks ICM analyses indicate that the proposed improvements will create no increase in 10-year, 100-year and 500-year storm sewer and overland peak flows towards the receiving outfall channel. Flow and water surface elevation were evaluated at four locations to determine no adverse impact to surrounding areas and downstream channels or systems. **Exhibits 6-11** depict locations where overland flow and water surface elevations were evaluated. As seen in these exhibits and the attached hydrographs for each location, there are no increases in peak flows at W153-00-00 south of Memorial Drive for the 10-year, 100-year and 500-year storm events.

5.1.1 Location 1 – Memorial Drive Overflow

As seen on **Exhibits 6-11**, Location 1 is located on the southern border of Memorial Drive near the existing 9'x9' RCB conveying channel W153-00-00, parallel to the road. This analysis line was selected to ensure no additional flow was leaving the Memorial Drive right-of-way. As seen in Table 7, Location 1 displays no adverse impact for both flow and water surface elevation for the 10-year, 100-year and 500-year storm events.

Table 7. Location 1 Impact Evaluation

	10-YR Event	100-YR Event	500-YR Event
Existing Max Flow Q (cfs)	0.00	420.33	1068.84
Proposed Max Flow Q (cfs)	0.00	403.22	976.09
Delta Flow Q (cfs)	0.00	-17.12	-92.75
Existing Max HGL (ft)	66.80	68.29	69.27
Proposed Max HGL (ft)	66.80	68.22	69.26
Delta HGL (ft)	0.00	-0.07	-0.01

5.1.2 Location 2 – W153-00-00 Downstream of Memorial

As seen on **Exhibits 6-11**, Location 2 is located downstream of Memorial Drive along W153-00-00. Location 2 discharges from System Outfall B. This analysis line was selected to ensure no additional flow enters W153-00-00 as a result of the Memorial Drive proposed improvements. This location includes the combined flow generated from both the existing storm sewer outfall and the overland sheet flow into channel W153-00-00. As seen in Table 8, Location 2 details no adverse impact for water surface elevations or streamflow for the 10-year, 100-year and 500-year storm events.

Table 8. Location 2 Impact Evaluation

	10-YR Event	100-YR Event	500-YR Event
Existing Max Flow Q (cfs)	667.18	794.45	906.29
Proposed Max Flow Q (cfs)	647.41	769.15	872.40
Delta Flow Q (cfs)	-19.77	-25.30	-33.89
Existing Max HGL (ft)	58.44	65.29	69.25
Proposed Max HGL (ft)	58.44	65.29	69.25
Delta HGL (ft)	0.00	0.00	0.00

5.1.3 Location 3 – Memorial Drive Outfall to Beltway 8 System

As seen on **Exhibits 6-11**, Location 3 is located at the intersection of Memorial Drive and Beltway 8. Location 3 discharges to System Outfall A. This analysis line was selected to ensure no additional flow enters the Beltway 8 drainage system as a result of the Memorial Drive proposed improvements. As seen in Table 9, Location 3 details no adverse impact for the water surface elevation or flow discharges for the 10-year, 100-year and 500-year storm events.

Table 9. Location 3 Impact Evaluation

	10-YR Event	100-YR Event	500-YR Event
Existing Max Flow Q (cfs)	608.86	766.60	708.26
Proposed Max Flow Q (cfs)	603.96	757.16	704.36
Delta Flow Q (cfs)	-4.90	-9.44	-3.90
Existing Max HGL (ft)	58.59	65.47	69.45
Proposed Max HGL (ft)	58.59	65.47	69.45
Delta HGL (ft)	0.00	0.00	0.00

5.2 Computational Nuances

A proposed terrain was developed within the project ROW to represent post-project conditions for the proposed design of the Memorial Drive roadway. This means that two different terrains were used between existing (LiDAR based) and proposed conditions (LiDAR based supplemented with proposed Memorial Drive roadway). The terrains were used to create the 2D mesh (or ground surface) within the model to simulate overland flow and ponding elevations. Since there are two different terrains, there was also the need to generate separate meshes for existing and proposed conditions. Due to the differences in the terrain within the Memorial Drive project ROW, small differences in the mesh elevations propagate across the full extents of the model. These minor elevation differences result in extremely minor mesh differences even away from the project limits. After evaluating the causes of the mesh differences, it has been determined that these locations are not representative of an increase in flood risk.

These locations do not represent an increase in flood risk because the minimal difference in ground elevation at a particular mesh element can produce a localized artificial impact. In all instances, the artificial impacts are fully surrounded by areas experiencing reductions or no changes to water surface elevation. To minimize these differences and artificial impacts, adjustments were made such as increasing the 2D mesh resolution throughout the entire model and other, more targeted, surface data adjustments such as mesh zones, break lines, and terrain-sensitive meshing.

5.3 Summary of Impact Analysis

As noted previously, the overall goal is to eliminate or mitigate adverse hydraulic impacts to areas upstream and downstream of Memorial Drive. This impact analysis demonstrates that there are no impacts at the critical flow and ponding locations noted above. These locations include system outfalls into both the Beltway 8 storm sewer and the downstream portion of channel W153-00-00. Additionally, the Memorial Drive project roadway alignment was evaluated to ensure that the overall water surface elevation is maintained or lower than existing conditions despite the

increased ponding depth generated from a lower roadway profile. A graphical representation of Tables 7-9 and the source model elements for the comparisons can be found in Appendix 4.

6.0 Conclusion

The purpose of this study is to present a hydrologic and hydraulic analysis for the Memorial Drive Reconstruction and Access Management project. The study shall determine the existing drainage needs of the project area, needs associated with the reconstruction of the new road and required mitigation for the system to avoid increase outflow for the systems.

For the proposed project, it was recommended that all storm sewer conduits within the project ROW be replaced. The coupled 1D/2D InfoWorks ICM analysis indicated that most trunk lines must be upsized to lower the 100-year water surface elevation below critical water surface elevation. This increase in conduit sizes would typically lead to increased outflow. To prevent increased outflow into W153-00-00, pipelines will be restricted to 42" RCP on the west and 24" RCP on the east of the improvements tying into the existing Outfall B. The peak outflows from the project area to downstream systems are decreased for the 10-year, 100-year and 500-year storm event due to proposed improvements. The hydraulic grade line for all the systems are generally lowered with localized areas experiencing marginal increases within the Memorial Drive ROW. However, the proposed improvements do not provide the ponding depth and water surface elevation reductions required to meet the 100-year criteria set by the City of Houston IDM. The recommended mitigation measures will provide additional roadway and underground storage and include a minor reduction in overall ponding extents outside of the Memorial Drive ROW without impacting areas downstream of Outfall A and Outfall B to prevent adverse impacts to the downstream HCFCD channels.

The differences in the peak volume of stormwater stored in subsurface storm sewer and surface roadway or ditch detention can be seen in Table 10 below.

Table 10. Peak Storage Volumes within Memorial Drive R.O.W.

		Storm Sewer Volume (ac-ft)	Surface Volume (ac-ft)	Total Volume (ac-ft)

APPENDIX 4.

IMPACT ANALYSIS LOCATIONS & RESULTS

Location 1:

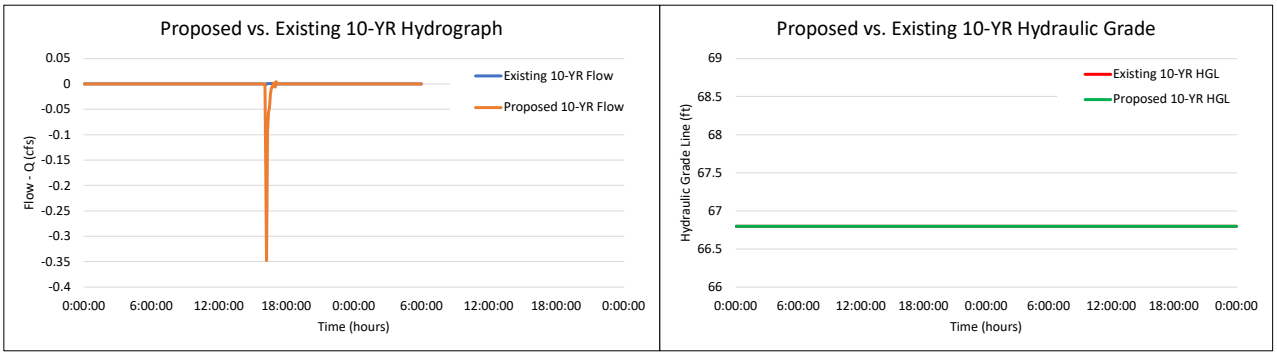
Overland flow leaving the southern right of way of Memorial Drive near channel W153

Location 1 Impacts			
	10-YR Event	100-YR Event	500-YR Event
Existing Max Flow Q (cfs)	0.00	420.33	1068.84
Proposed Max Flow Q (cfs)	0.00	403.22	976.09
Delta Flow Q (cfs)	0.00	-17.12	-92.75
Existing Max HGL (ft)	66.80	68.29	69.27
Proposed Max HGL (ft)	66.80	68.22	69.26
Delta HGL (ft)	0.00	-0.07	-0.01

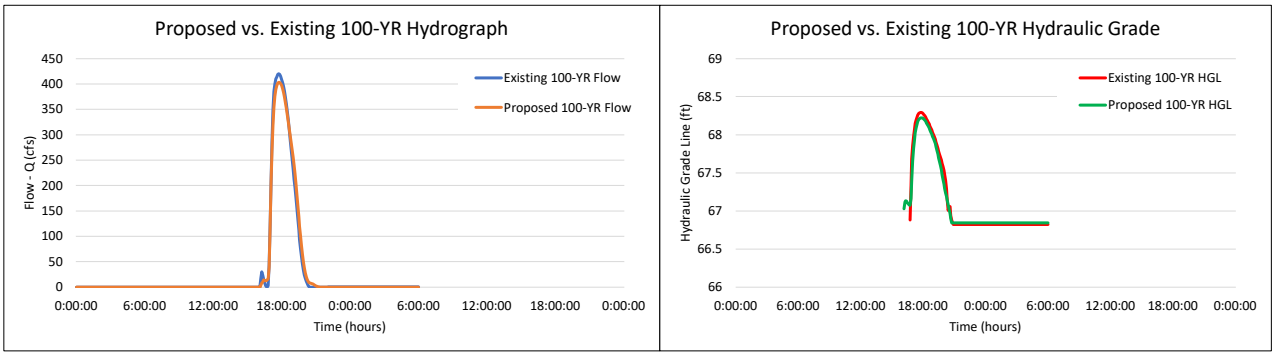
* Flow evaluated with ICM Results Line Object named **'Location 1 - Flow'**

Elevation evaluated with ICM Results Point Object named **'Location 1 - WSEL'

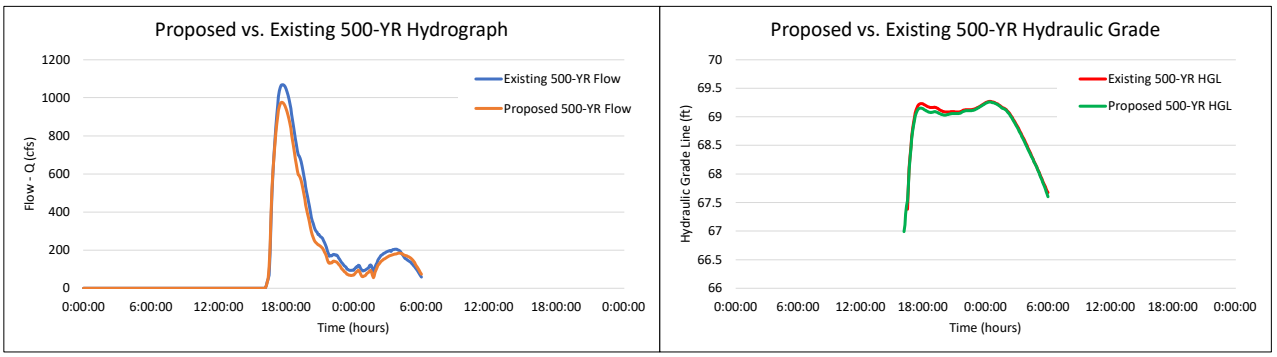
10-YR Flow and Elevation Comparisons



100-YR Flow and Elevation Comparisons



500-YR Flow and Elevation Comparisons



Lockwood, Andrews & Newnam, Inc.
A LEO A DALY COMPANY

Texas Department of Transportation

Location 2:

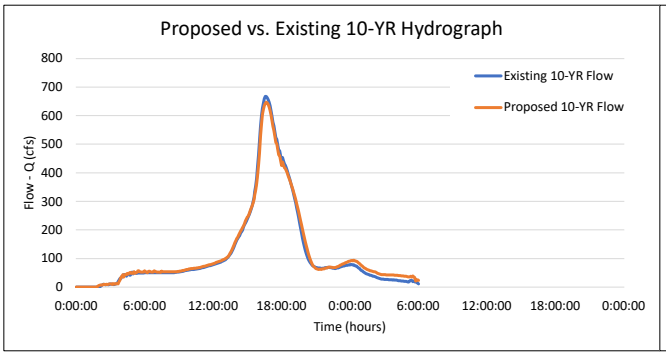
Channel W153 downstream of Memorial Drive improvements

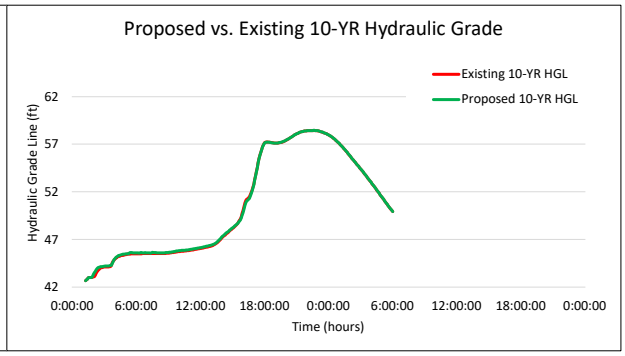
Location 2 Impacts			
	10-YR Event	100-YR Event	500-YR Event
Existing Max Flow Q (cfs)	667.18	794.45	906.29
Proposed Max Flow Q (cfs)	647.41	769.15	872.40
Delta Flow Q (cfs)	-19.77	-25.30	-33.89
Existing Max HGL (ft)	58.44	65.29	69.25
Proposed Max HGL (ft)	58.44	65.29	69.25
Delta HGL (ft)	0.00	0.00	0.00

* Flow evaluated with ICM Results Line Object named **'Location 2 - Flow'**

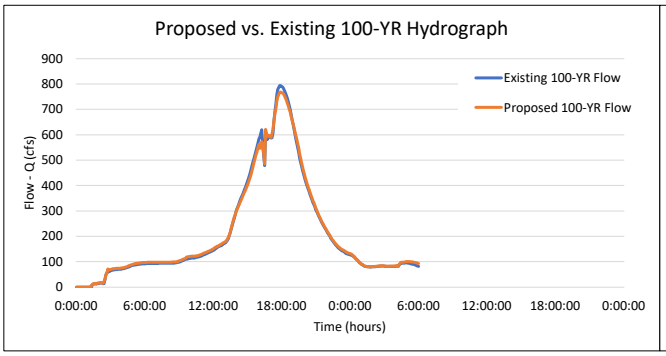
Elevation evaluated with ICM Results Point Object named **'Location 2 - WSEL'

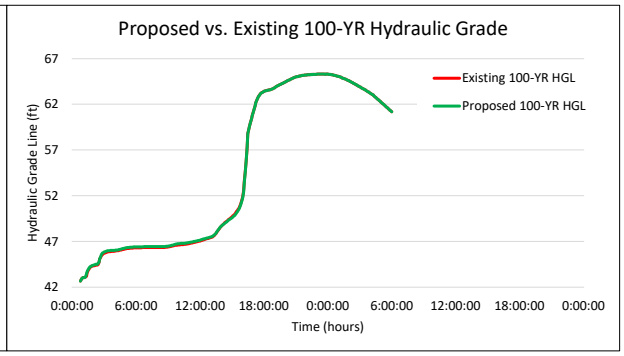
10-YR Flow and Elevation Comparisons



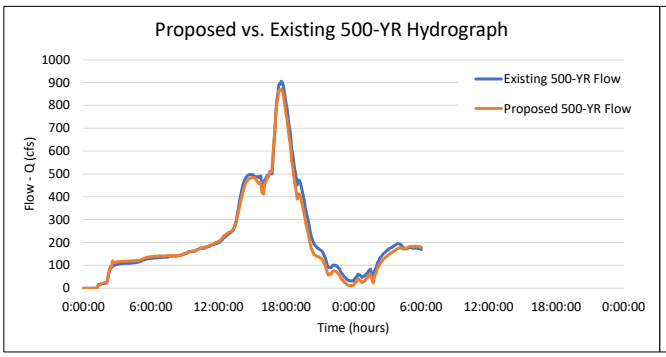


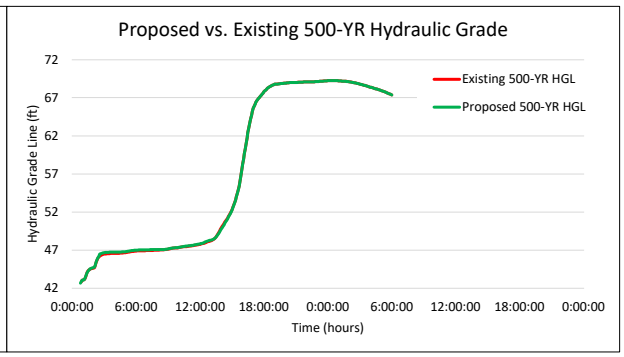
100-YR Flow and Elevation Comparisons





500-YR Flow and Elevation Comparisons





Location 3:

Memorial Drive storm sewer discharging to the west into the Beltway 8 storm sewer system and Buffalo Bayou

Location 3 Impacts			
	10-YR Event	100-YR Event	500-YR Event
Existing Max Flow Q (cfs)	608.86	766.60	708.26
Proposed Max Flow Q (cfs)	603.96	757.16	704.36
Delta Flow Q (cfs)	-4.90	-9.44	-3.90
Existing Max HGL (ft)	58.59	65.47	69.45
Proposed Max HGL (ft)	58.59	65.47	69.45
Delta HGL (ft)	0.00	0.00	0.00

* Flow evaluated with 'DS Flow' property of ICM Conduit Link named **'3124545.1'**
Elevation evaluated with 'DS Head' property of ICM Conduit Link named **'3124545.1'
